ARGUMENT

1. Restriction requirement

Applicant respectfully requests reconsideration and withdrawal of the restriction requirement.

“Where, as disclosed in the application, the several inventions claimed are related, and such related inventions are not patentably distinct as claimed, restriction under 35 U.S.C. 121 is never proper (MPEP § 806.05).” MPEP 808.02 (emphasis added). The claims of Groups II and III are not patentably distinct from the claims of Group I.

Manufacture, use, or sale of the subject matter of the claims in Groups II and III necessarily would involve manufacture, use, or sale of the subject matter of the claims in Group I.

The argument that applicant previously made--that if the claims in Group I were allowable, then the claims in Group II and III were also allowable--was an attempt to Make this argument, albeit in different words than those used in the MPEP. Applicant respectfully requests reconsideration of the restriction requirement and reinstatement of the claims in Groups II and III.

2. Objections

The examiner issued a number of objections to the specification and claims. The foregoing amendments are believed to overcome the objections. With respect to the objection to claims 25 and 26, Applicant respectfully submits that these claims do not include silicon in the Markush grouping. Claim 21 includes silicon and claim 22 has been amended to include silicon. Claims 25 and 26 further limit claims 21 and 22 by the omission of silicon.

With respect to objection 2c, the examiner queried the fracture toughness of 70% silica-filled resin. The examiner asks "How could a fluctuation factor be more than 50% of the value." As best as Applicant can interpret this query, the examiner is asking how the amount of filler could be varied by 50%. Applicant submits that one of the advantages of the present invention is that similar mechanical properties are obtained using much less of the claimed zirconia filler than would be required using a silica filler.

Rejections Under 35 U.S.C. § 112, first paragraph

Applicant has amended the claims to be limited to zirconium oxides. Applicant traverses the argument that the specification does not provide an adequate definition of “mobile adhesion promoters.” The following definition spans from page 15, line 5 - page 16, line 5 of the specification:

Preferred “mobile adhesion promoters” are defined as surface-active molecules which strongly bind to the surface of the metal oxide cluster, preferably via primary chemical bonding, most preferably irreversibly. In a preferred embodiment, the polar end of the surface-active molecule preferably is bound to the surface by displacing the hydrogen of a hydroxyl group. The hydrophobic tail of the mobile adhesion promoter may intertwine with, but preferably does not chemically react with molecules in the matrix resin. Suitable mobile adhesion promoters include, but are not necessarily limited to silanes, phosphonates, phosphates, chelating agents, such as acetylacetone, fatty acids, such as stearic acid, fatty alcohols, and ester linked fatty acids. Preferred mobile adhesion promoters are silanating agents.

Preferred silanating agents are silanes bearing substituents selected from the group consisting of: from about 1 to about 3 alkyl groups having from about 1 to about 18 carbon atoms; from about 1 to about 3 alkenyl groups; and, from about 1 to about 3 substituents selected from the group consisting of chlorine, bromine, and an alkoxy group having from about 1 to about 4 carbon atoms. Preferred silanating agents have substituents selected from the group consisting of: one alkenyl group; two alkyl groups having from about 1 to about 3 carbon atoms; and, one alkoxy group having from about 1 to about 3 carbon atoms. A most preferred secondary surface agent is dimethyl ethoxy vinyl silane (DMEOVS) (U.S. Patent No. 4,504,231, incorporated herein by reference). DMEOVS has the benefit of increasing the double bond density of the cluster surfaces while also being volatile enough that excessive amounts can be easily removed from the system. Nevertheless, the agent’s greatest value is its ability to displace as many hydroxyl groups from the zirconia surfaces as possible and then to remain in place long enough to allow the particles to be homogeneously dispersed in a highly hydrophobic resin.

The Federal Circuit consistently has held that:

[A] specification disclosure which contains a teaching of the manner and process of making and using the invention in terms which correspond in scope to those used in describing and defining the subject matter sought to be patented **must be taken as in compliance with the enabling requirement of the first paragraph**

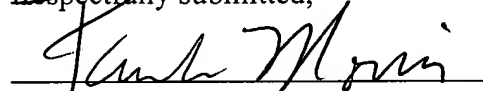

of § 112 unless there is reason to doubt the objective truth of the statements contained therein which must be relied on for enabling support.

Fiers v. Revel, 25 USPQ 2d 1601, 1607 (Fed. Cir. 1993), citing *In re Marzocchi*, 439 F.2d 220, 223, 169 USPQ 367, 369 (C.C.P.A. 1971) (emphasis added). “How such a teaching is set forth, whether by the use of illustrative examples or by broad descriptive terminology, is of no importance.” *Staehelin v. Secher*, 24 USPQ 2d 1513, 1516 (B.P.A.I. 1992) (emphasis added).

The examiner has not provided technical reason to doubt the objective truth of the quoted statements. Therefore, the claims “must be taken as in compliance with the enabling requirement of the first paragraph of § 112.

The Commissioner is hereby authorized to charge any fees for this response to Deposit Account No. **50-0997(SWRI-2749A)**.
